

## Wifi Hot Spot WebPhone

pieNETWORKS Limited (“pie”) is pleased to announce the launch of its Wifi (wireless) Hot Spot WebPhone.

The Wifi Hot Spot WebPhone is a Voice over Internet Protocol (‘VoIP’) payphone, internet access terminal, Wifi hot spot and digital product terminal (eg. Phone ringtones, mobile phone ‘top ups’, music downloads, digital photograph uploads, bill payment, internet banking etc).

It has been developed to address the existing payphone market. In recent years the ubiquity of mobile phones and advent of ‘capped’ mobile phone plans has meant a steady decline in the usage of traditional payphones for long distance, calls to mobiles and international calls.

Pie believes its new VoIP WebPhone will revitalize the use of payphones by offering lower cost long distance, calls to mobiles and international calls as well as the added functionality of internet access, Wifi hot spot capability and digital product download.

Being a Wifi hot spot the WebPhone also has the potential to become a component of future mobile telephone networks as manufacturers enable their mobile phones to operate across the Wifi spectrum.

Pie has already received expressions of interest in the WebPhone product from telecommunication companies overseas and has commenced discussions with interested parties in Australia.
